EPISTEMIC-AWARE DRO · 72 US ETFs · 2010–2024

Three pre-registered attempts. The holdout is still untouched.

What I learned trying to make uncertainty pay.

v1 Epistemic uncertainty

H1 / H3 fail · H2 pass
Ridge mean + bootstrap σ
no stable mean or uncertainty signal

v2 Conformal quantiles

Stopped before holdout
coverage 0.899 / 0.859
information gate 65.4% < 80%

v3 Conditional tail risk

Stopped before holdout
calibration 4.29% vs 4.30%
information gate 43.0% < 80%

Calibration ≠ information. Gates > narratives.

Three negative results. Zero holdout touches. The apparatus is the result.
